

# Simple Trebuchet

## Relevant Equations

Equation for V (Velocity of ball)

$$v = \sqrt{\frac{(2mg(\sin(\theta_1)) + (\sin(\theta_2))r)}{\frac{1}{12}m_2(2r)^2 + m(r)^2 + m_b(r)^2}}$$

Equation for X (Distance covered by ball)

$$x = (\cos(\theta_3)v) \left( \frac{\sin(\theta_3)v}{g} + \sqrt{\frac{2H_g + 2(\sin(\theta_3)vg) - (v \sin(\theta_3))^2}{g^2}} \right)$$

### How equations were derived:

Through the use of principles such as Conservation of Energy, Inertia and Torque , and Energy of Rotating Systems, these equations calculating distance and velocity of a ping-pong ball being launched from a simple trebuchet were able to be derived
